- The beam parameters are calculated indirectly according to the measured beam emittances at the slits position.
- The beam parameters is variable for different ion species and different ion source conditions.
- Parameters above is only used in the following simulation as reference, which is in reasonable range.

### The initial beam is asymmetrical at the exit of LECR4

# Beam matching conditions

#### Updating case: Non-symmetrical input beam

由国科学院近代物理研究所

IMP

Revised

BEAMPATH

The Tracewin code is used for single beam.

The PIC code has been developed based on Beampath for simulation of high intense mixed heavy ion beams.

The intensity distribution of different Q/A ions in the simulation

> The initial beam includes 26 different Q/A values,  $Bi^{19+}$  to  $Bi^{37+}$  and  $O^{1+}$  to  $O^{7+}$ , according the to measurement results of LECR4.

### Symmetrical w/o space charge

In case of symmetrical input beam without space charge, the target beam can be separated clearly and the beam size is about 7 mm at the slits

#### Non-symmetrical w/o space charge

In case of no space charge, the target beam can still be separated clearly

#### Non-symmetrical with space charge

Non-symmetrical input beam with beam current of 5.8 emA and space charge neutralization degree of 0.82; beam hollow appeared.

# An explanation of "hollow"

The sharp focused higher Q/A beam components pushed the lower Q/A beam radially outwards to form the beam "hollow" of desired beam.

- Problems in the previous A/Q selection system
- PIC simulation of space charge effects of multi-species ions beam
- Modified A/Q selector for high intense ions beam
- Beam experiments

科学院近代物理研究所

Considerations of Q/A selector on high intensity low energy heavy ion beams

## Momentum resolution

- The distance between heavy ions with the adjacent charge state at the slits position is larger than the beam size.  $\Delta x \approx (1 + \frac{L}{\rho_0}) \cdot \frac{B\rho - (B\rho)_0}{B_0}$ 

## Acceptance

 The maximum acceptance of Q/A selector, and the beam size at the slits meets:

$$\sigma_{beam} = \sqrt{\varepsilon_{x,\text{total}} \cdot \beta_x} < \Delta x / 2$$

Space charge judgement

The effect of the space charge on the momentum resolution and transmission

# Single solenoid Double solenoid scheme

### - Separated functions,

- The first solenoid: control beam size in the beam channel, for the good transmission efficiency
- The second solenoid: control the beam waist position and reduce the field strength of the 1st solenoid, suppressing the "short foci" effect.
- Opposite polarity,
  - Eliminate the beam coupling in the transverse phase space.

中国科学院近代物理研究所 Institute of Modern Physics, Chinese Academy of Sciences

### Case1: Symmetric input beam

IMP

HB2016, Malmö, Sweden

### Case2: Non-symmetric(0 emA)

Double solenoid with same polarity

由国科学院近代物理研究所

Institute of Modern Physics, Chinese Academy of Sciences

IMP

#### Case2: Non-symmetric(1 emA)

#### Tracewin

Single solenoid

results

# PIC tracking(1 emA)

Revised BEAMPATH

- The total beam current is set to 1 emA
- $\diamond$  26 Q/A ion species
- The target beam can be separated clearly and the beam size is smaller than 10 mm at the slits.

 $B_{sol1}=0.31 \text{ T}$  $B_{sol2}=-0.36 \text{ T}$ 

# PIC tracking(1 emA)

#### Revised BEAMPATH

- The vertical emittance growth of ~100%, horizontal emittance growth of ~50%.
- The field strength of the second solenoid increase by 33% compared to that for single ion species.
- Serious distortion in the x-y space, the effect of highorder nonlinear space charge of mixed heavy ions beam cannot be ignored.

- Problems in the previous A/Q selection system
- PIC simulation of space charge effects of multi-species ions beam
- Modified A/Q selector for high intense ions beam
- Beam experiments

创学院近代物理研究所

## Modified Q/A Selector

### **Experimental Results**

(Bi <sup>28+</sup> = 75 euA)	02+
Frequency (GHz)	18
RF power (kW)	0.8
Extraction Voltage (kV)	23
Beam loading (emA)	5.5
Beam current of Bi <sup>28+</sup> (euA)	75

I

- The experimental results has a good agreement with the PIC simulations.
- Serious distortion in x-y space, the effect of high-order nonlinear space charge of mix heavy ions beam cannot be neglected.

 For high intensity high charge state ECRIS that required by future heavy ion accelerator projects, Q/A selector is still very challenging task.

学院近代物理研究所

- Space charge field of mixed heavy ion beams plays key role in the beam "hollow" formation.
- Double solenoid scheme is proved to be able to eliminate the beam "hollow" formation and reach good momentum resolution.
